Small tools and practical computer help

I'm Dima Mak, also known as ub3dqy. I make small tools for everyday tasks and help work through confusing computer and software problems.

Maybe you keep doing the same job by hand. Maybe an app has stopped working and the instructions only make things more confusing. Tell me what you want to get done, and we'll work out a sensible way forward.

01 / Small tools for repetitive work

Compare folders, prepare file names, check lists or turn a string of small steps into one useful tool.

You get a tool for the agreed task, a checked example and a short explanation of how to use it.

02 / Help with a stubborn problem

An app won't open, a guide skips a step, or an error keeps interrupting something you need to finish.

You get an explanation of what the evidence shows, practical next steps and a clear account of what still needs checking.

03 / Everyday computer help

Photos and documents, keeping track of copies, choosing the right folder or following an installation guide.

You get clear steps for the task in front of you. If a change could affect your files, we agree what to change and what to keep first.

The next page shows three working examples. You can download them and try them on your own computer.

Three examples you can try

These small projects were made for this portfolio. The supplied file names and situations are examples.

01 / Check a folder copy

"Did everything make it into the copy?"

Choose two folders. The tool lists missing files, extra files and different sizes. It flags names differing only in letter case.

It compares names and sizes, not file contents. Nothing is moved or deleted.

02 / Plan a set of new file names

"I want these photo names in a sensible order."

Preview names such as Trip-001.jpg. File endings are kept, and clashes in the supplied list are marked before you use the plan.

This is a preview. It does not rename files or inspect other files in the folder.

03 / Put a help request together

"I know something is wrong, but I cannot explain it clearly."

Write what you wanted to do, what happened and what you have already tried. The tool puts those details into a clear message.

It does not diagnose the problem or send a message.

Try them without installing anything

Download the example ZIP from the portfolio, extract all the files and open index.html. English is the default; the Russian button switches the page. Your files and text are not uploaded.

Open the portfolio and example downloads

Improvements accepted by other projects

These contributions were made through my GitHub account, ub3dqy, and accepted by the project maintainers.

Clearer Windows setup

Explained how to choose a local folder and distinguish it from a OneDrive folder in Screenshot Organizer.

View the accepted change

Fewer steps to get the example files

Replaced two file-page links with direct file links and explained how to save them in the ShareR walkthrough.

View the accepted change

A less confusing first exercise

Clarified the starting point and made the expected report easier to read in Data Engineering Launchpad.

View the accepted change

These changes improved the instructions. The applications themselves belong to their respective projects.

Tell me what you're trying to do

Send a few lines about what you wanted to do and what happened instead. Include the error message, if there is one, or a screenshot with personal details hidden.

We'll agree on what's included, the price, the deadline and the payment method before work starts. I'm registered as an individual entrepreneur. If you need business paperwork, let me know when you describe the task.

Reply in the conversation where you received this portfolio, or leave a short request on GitHub. Keep personal files and sign-in details out of public posts.
